

## ABSOLUTELY WATERTIGHT!

Steam distribution system for available steam  
Condair ESCO

Humidification and evaporative cooling

 **condair**

# Steam distribution system for available steam

**Patented main-flow nozzles facilitate condensate-free steam discharge**  
Main-flow nozzles remove steam from the middle of the distribution pipes where it is hot and condensate-free. This ensures that the air hoses behind the distribution system remain dry.

The nozzles are made of solid stainless steel. They work reliably, are long-lasting and resistant to aging, and do not leak.

**Pipe connections**  
Ready to be connected

**Rotary slide valve closes with absolutely tightness**  
The ceramic valves close with absolute tightness. When the system is switched off they prevent steam from entering the ventilation system and they do this without any additional shut-off device.

**Condair ESCO design: GGG40**  
Condair ESCO steam connection unit with reliable GGG40 material quality and extensive area of application in air conditioning systems.

Important components such as:  
■ flanged joint  
■ strainer  
■ steam dryer  
■ rotary slide valve  
■ condensate eliminator  
are already included and do not have to be separately installed.

**Condair ESCO design: AISI304**  
Steam connection unit in AISI304 stainless steel quality for special steam mains requirements.

**Steam distribution system**  
Condair ESCO steam distribution system with ready-for-connection pipe joints are built as modules. Without threaded sealing they are easy to mount and are watertight.

**Primary and secondary condensate cycle**

## Rotary slide valve closes with absolutely tightness and works precisely

The valve operating mechanism is designed as a rotary drive, supplying high accuracy and reliable operation. The low actuating forces needed by the rotary slide valve and the direct power transmission allow for a compact and space-saving design. Conventional electrical and pneumatic humidity controllers can be connected.

Precise steam release based on a linear valve characteristics curve  
The linear characteristic curve of rotary slide valves allows uniform steam release over the entire output range. This ensures that steam release at every operating point coincides with the valve position. In high control requirements this is a decisive advantage.

Rotary slide valve closes with absolute tightness  
The ceramic valves close with absolute tightness. When the system is switched off they prevent steam from entering the ventilation system and they do this without any additional shut-off device. Undesirable condensate buildup is thereby safely prevented without additional measures.

## Homogeneous steam distribution and shortest humidification distances

Short humidification distances are decisive factors for reliable and hygienic steam humidification. In air conditioning systems there must be no vapor in air pipe installations. Damp surfaces, water accumulation and hygienic risks would be the consequence.

Condensate-free steam with patented humidification nozzles

The patented steam nozzles remove steam only from the main flow of the distribution pipes where the steam is hot and condensate-free. In this manner they ensure that the air hoses behind the distribution system remain dry.

Made of solid stainless steel, they work reliably, are long-lasting and resistant to aging, and do not leak.

Uniform humidity profile through optimal distribution

The structural design of the distribution systems allows for precise steam discharge on the individual nozzles. The two systems, DL40 and DR73, allow individual design for every application and obtain the best values in homogeneity. The injected steam is quickly and evenly absorbed by the air current.

Patented main-flow nozzles

## Tailor-made solution

The Condair ESCO steam humidifier variants facilitate ideal placement in every conceivable system situation. The plan specifications and design of the air conditioning system are decisive factors for the selection of the variant. Even tricky installation conditions can be optimally resolved.

Condair ESCO DL40

The DL40 can be tailored flexibly to the air duct system using one, two or three horizontal steam distributors. This means considerable freedom in steam output and constructive design of the humidification chamber.

Condair ESCO DR73

The DR73 is always the best choice, whether you are going for the highest steam outputs or shortest humidification distances. The steam distribution system is individually designed around existing requirements and structurally tailored to the mounting situation. The two-sided steam discharge on the nozzle assemblies allows homogeneous steam distribution over the entire cross-section of the air duct.

Series:  
Condair ESCO DL40

Series:  
Condair ESCO DR73

Series DL 40 with single distribution

Series DL 40 with double distribution

Series DL 40 with triple distribution

Series DR 73 with system-specific multiple distribution

Technical Data

Series	Valve size	Steam pressure	Steam output	Air duct width
		[bar(g)]	max. [kg/h]	max. [mm]
DL40	Esco 5	0.2-4.0 bar(g)	127	4,000
	Esco 10	0.2-4.0 bar(g)	250	4,000
	Esco 20	0.2-4.0 bar(g)	500	4,000
DR73	Esco 10	0.2-4.0 bar(g)	250	10,000
	Esco 20	0.2-4.0 bar(g)	500	10,000
	Esco 30	0.2-4.0 bar(g)	2,000	10,000

Tabular overview of expected humidification distances When the specified applications are individually calculated, this usually results in further improved values which are guaranteed.
